### SpineTRACK QCDR MEASURES 2019

#### Denominator Exclusions
- No

#### Patient Reported Functional Outcomes
- No

#### Quality of Life-Mental Health
- Yes

#### Outcome
- N/A

#### High Priority Type
- Denominator

#### Existing Approved QCDR
- Yes

#### Effective Clinical
- No

#### QCDR Measure Type
- Patient Reported Functional Outcomes

---

This page contains information on QCDR measures for the SpineTRACK project, focusing on outcomes and measures related to pain and quality of life. The content outlines the criteria for selecting high-priority measures and the use of patient-reported outcomes (PROs) in clinical research. It emphasizes the importance of PROs in improving care and recommends their incorporation into clinical settings. The page also highlights the role of Quality of Life (QoL) PROs in showing statistically significant improvement, especially in chronic conditions like spinal disorders.

In summary, the SpineTRACK QCDR measures emphasize the use of PROs to assess patient experience and satisfaction, with a focus on significant clinical change and the importance of follow-up assessments post-surgical interventions.
